Safety Yellow Silicone Walkway System

Carlisle Roof Foam and Coatings (CRFC) is committed to safety and dedicated to protecting your commercial roof and the people who work on it. CRFC’s Silicone Walkway System provides a highly visible and durable walkway and can also be used as a building perimeter warning line, around access points, HVAC equipment, and hazardous areas. The Silicone Walkway System adds durability in high-traffic areas and provides slip resistance.

About the Silicone Walkway System

- The first part of the system is the SeamlesSEAL™ ULTRA Safety Yellow Silicone Coating, which is a single-component, moisture-cured silicone coating. The SeamlesSEAL ULTRA Safety Yellow Silicone Coating is applied with a medium nap roller.
- Immediately after the application, CRFC’s Seal-Tek Safety Yellow Granules are generously and evenly broadcast into the wet coating as the second part of the system.
- After a few minutes, the surface should be inspected and granules reapplied as needed to achieve a continuous and consistent embedment.
- Once the coating has cured, remove all loose granules with a soft-bristled push broom or a small hand blower.
- The SeamlesSEAL ULTRA Safety Yellow Silicone Coating can also be used independent of the granules.

The Silicone Walkway System also can be used to create highly visible piping and conduit on roof systems to minimize trip hazards and as perimeter warnings.
Help protect your roof’s surface from wear and damage around HVAC units and high-traffic areas with CRFC’s Silicone Walkway System. For more information please contact your local sales representative.
